*Ambient Intelligence: Computational
Audio Processing For Human Fall
Detection*

Dottorato in Ingegneria dell'Informazione
Progetto Eureka

13-14 Marzo 2019, www.univpm.it

Outline

- **Introduction**
 - Fall Detection System and Challenge
 - Motivations and Contributions
- **Dataset**
 - A3FALL Dataset
 - FAS
- **Supervised Approaches**
 - SVM based approach
- **Unsupervised Approach**
 - End-To-End CNN-AE
- **Weakly-supervised Approach**
 - OCSVM + User-Aided Template Matching
 - Few-shot Siamese Neural Networks
 - Robust Metric Learning with Siamese Autoencoders
- **Conclusions**
- **References**
- **Publications list**

Where we are going: Ambient Intelligance (Aml)

Capabilities

- integrated into the environment
- context-aware
- tailored to the user need
- able to adapt actions in new scenarios
- minimal user intervention

A digital environment that proactively, but sensibly, supports people in their daily lives.

Requirement

- Sensor interaction and interoperability
- Pervasive Ubiquitous Computing
- Artificial Intelligence

Index

Human fall: a real problem for society

"And why do we fall, Bruce? So we can learn to pick ourselves up" cit. Alfred - Batman Begins

- 62% of injury-related hospitalizations for the people over 65 years are the result of a fall [1]
- main cause of death due to accidents for people over 65 [2]
- can lead to psychophysical repercussions on people [3]

We can introduce an FCS system in an Aml to:

- Monitoring of the elderly or people who live alone
- Assistance time reduction

Fall Classification System Challenge [4]

- Try to collect sufficient human fall data: supervised or analytical methods
 - difficulty in retrieving examples that represent human falls
- Deal with no human fall data: Novelty detection approach
 - good description of "normality"

Related Work

 - Gyroscopes
- Environmental
 - **Vision System**
 - Audio microphone
 - Radar doppler

Issues

- no standard datasets;
- no standard methodology
- difficult comparison with other methods;
- no audio dataset available
- scarcity of real human falls

Motivations and Contributions

Analytical methods:

- exploiting some a priori knowledge;
- manual tuning of the hyperparameters;
- applying a threshold on acquired signals or features;

They can hardly perform when the operating conditions and the subjects are variable.

Machine learning methods:

- learns from the data;
- can be forced by exploiting some a priori knowledge;
- no need of manual tuning of the hyperparameters;

They need more data!

Contributions

- audio based fall detection is a reliable alternative;
- proposal and evaluation of the FD task dedicated FAS sensor;
- proposal of the acoustic A3FALL dataset to the community.

The fall events dataset: A3Fall

Recording Rooms

- R0 - rectangular room particularly suitable for the propagation of acoustic waves through the floor;
- R1 - university auditorium room in which the flooring is composed of fitted carpet;
- R2 - a recording studio
 - sensors placed in the live room;
 - audio events performed in the control room.

Recording set-up

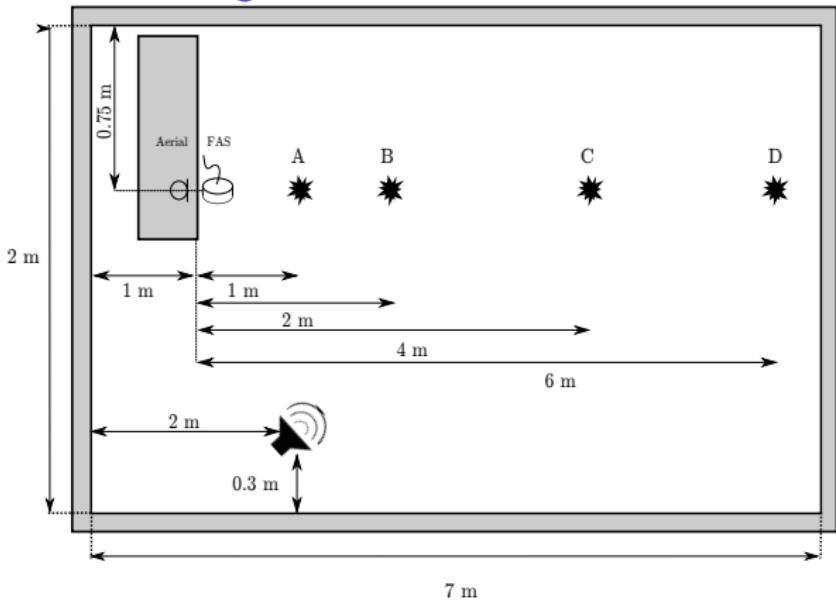

Sampling

- Sample Rate:
44.1 kHz
- Bit-depth:
24 bit

Used sensors:

- Mic. array (3)¹
- FAS v1¹

The recording room

¹AKG C400 BLT.
10 of 40

Floor Acoustic Sensor[1]

1. The outer container
2. The inner container
3. The microphone slot
4. The membrane touching the floor

Advantage

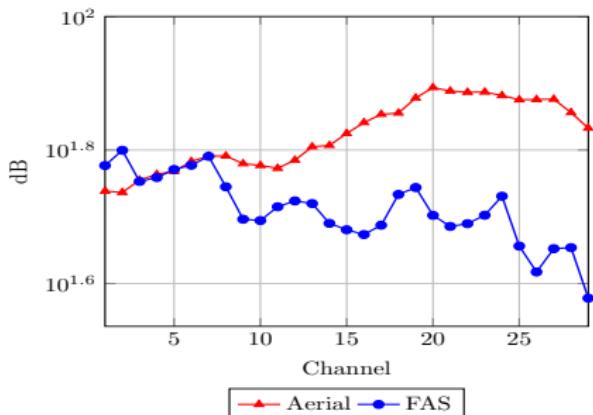

- Easily integrated into the environment
- More sensitive to signals related to falls
- Allow to work with a lower sampling frequency

3D printed prototype

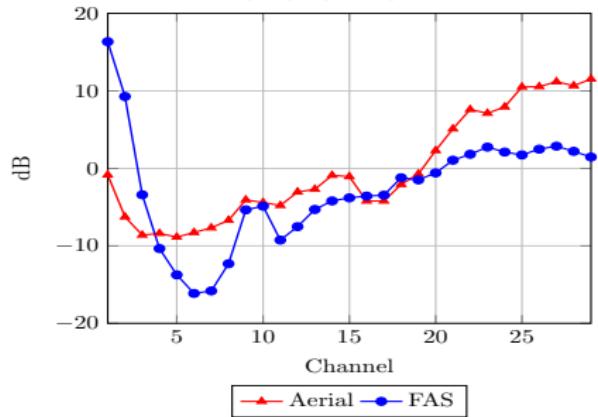

Signals analysis

Average value of the mel channels

Average value of the SNR for each mel channel

Remark

- The “valley” in the curves is due to the pitch of the music signal
- The FAS is better at low frequencies

Few-shot Siamese Neural Networks¹

$$\text{Loss} = (1 - Y) \frac{1}{2}(E_w)^2 + (Y) \frac{1}{2} \{(\max(0, m - E_w))^2\}$$

¹Best Presentation @ International Conference on Pattern Recognition and Artificial Intelligence (PRAI2018) Kean University, Union, NJ, USA
25 of 40

Training Phase

Consider X_1, X_2 as a pair of two input samples.

Euclidean Distance

$$E_w = \|S_e(X_1) - S_e(X_2)\|. \quad (1)$$

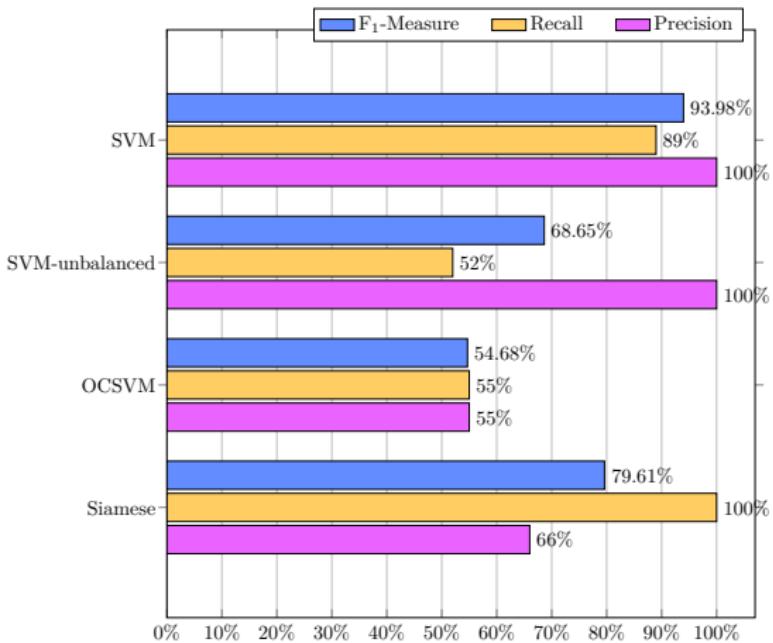

with $S_e(X_1)$ and $S_e(X_2)$ the mappings performed by the network

The label for training a SNN are built as follows:

- Positive examples labelled as 0: pair of input samples belonging to the same fall event class
- Negative examples labelled as 1: pair of input samples not belonging to the same fall event class

Results

- Trained:
 - objects fall
 - 1 human fall
- Validation:
 - objects fall
 - few human fall
- Tested with:
 - objects fall
 - human fall

Robust Metric Learning with SCAE

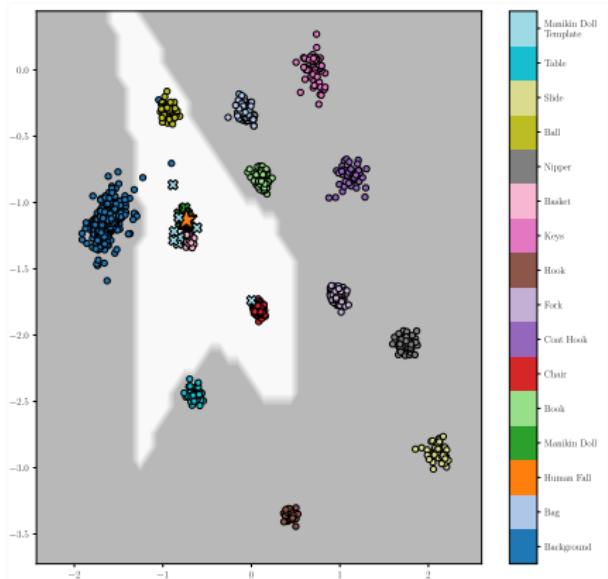

Training procedure

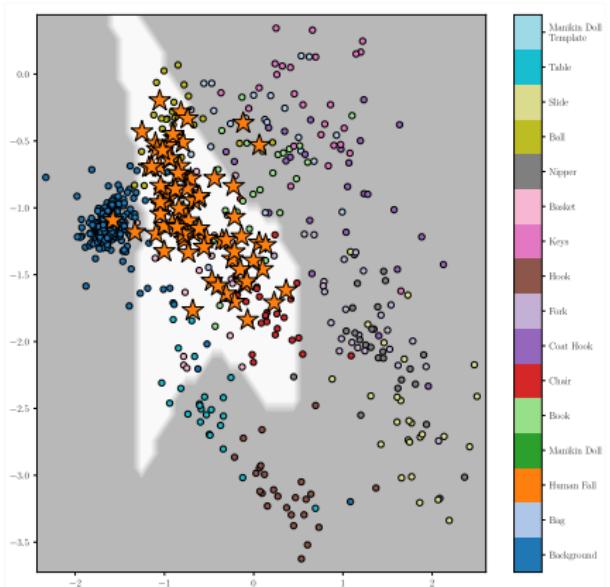

- contrastive loss of latent spaces
- contrastive loss of reconstructions
- reconstruction loss (mse) of latent spaces
- to exploit the few human fall samples available a smart selection of the train pairs has been done:
 - neither the real falls nor the simulated falls were coupled with the falls of the objects
 - simulated and real falls were coupled together
- induces the network to make a transformation in the latent layer
- simulated human fall can be used as real human fall template in the final classifier
- KNN classifier trained with extracted feat. from the **Encoder**

Latent space with 2 neurons

Train set

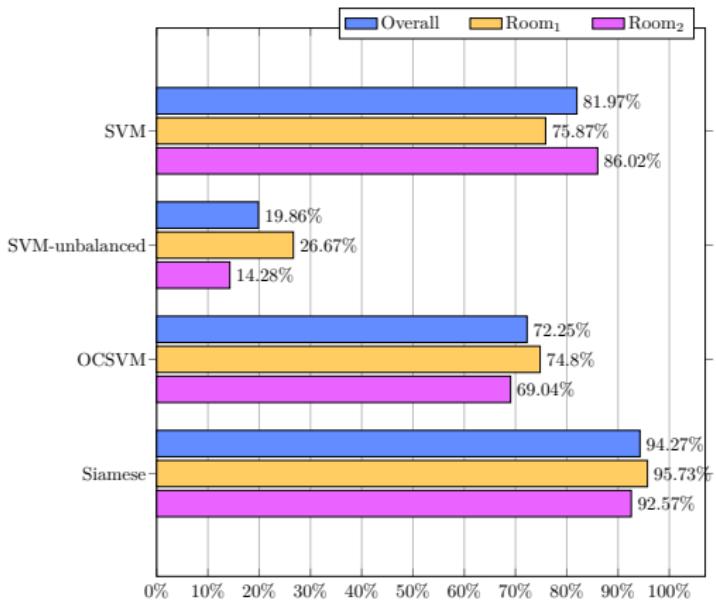

Test set

Results

- Trained (3 room):
 - objects falls
 - backgrounds
 - manikin doll falls
 - 1 human fall per room
- Testset composed of:
 - objects fall
 - human fall
 - backgrounds

Conclusions

- FAS sensor proposed and evaluated
- A3FALL dataset with real human falls
 - real human falls
 - different floor types
 - different rooms
- different scenarios explored from a data availability prospective
 - supervised
 - unsupervised
 - weakly-supervised

Future works

- data fusion (different type of sensors)
- approach fusion
- exploit the Aml ecosystem (different algorithms)

MFCC pipelines used

- STD: MFCC calculated as described above
- NOPRE: no pre-emphasis filter
 - to reduce the high frequencies emphasis

SVM based methods optimization

SVM and USVM Gridsearch

GMM

- number of gaussians:
 $[2^0, 2^1, \dots, 2^6]$

SVM

- $C : [2^{-5}, 2^{-3}, \dots, 2^{15}]$
- $\gamma : [2^{-15}, 2^{-13}, \dots, 2^3]$

OCSVM Gridsearch

GMM

- number of gaussians:
 $[2^0, 2^1, \dots, 2^6]$

SVM

- $\nu : 2^{-5}, 2^{-3}, \dots, 2^{15}$
- $\gamma : [2^{-15}, 2^{-13}, \dots, 2^3]$

For all the methods the F_1 Measure were used for the optimization.

$$F_1 = 2 \cdot \frac{\text{precision} \cdot \text{recall}}{\text{precision} + \text{recall}}$$

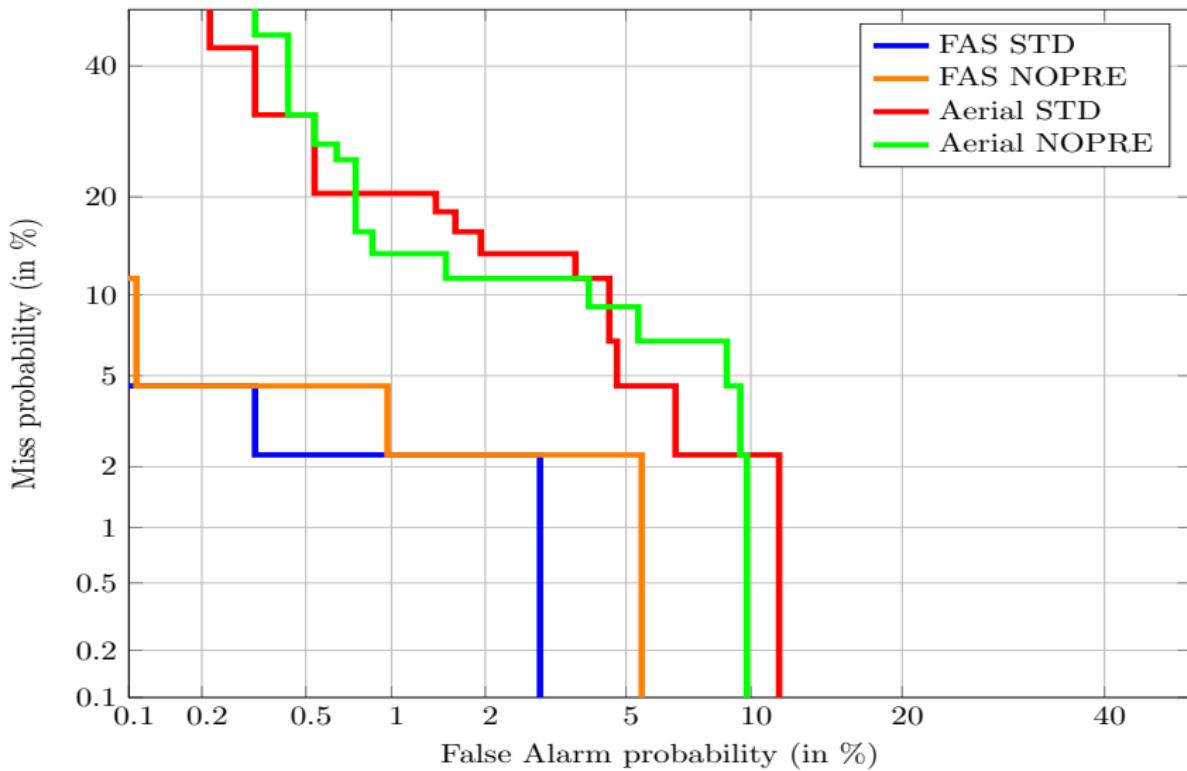

Acoustic Scenarios for SVM based approaches

The experiments have been conducted with a 4-fold cross-validation strategy and a three-way data split in three different operating conditions:

- matched, where the training, validation and test sets share the same acoustic condition, i.e., clean or noisy;
- mismatched, where the training set is composed of clean signals while the validation and test sets are composed of noisy signals;
- multicondition, where the training, validation and test sets contain both clean and noisy data. In this case the sets have been divided so that they contain 1/3 of clean data and 2/3 of noisy data.

Binary-SVM Multicondition DET plot

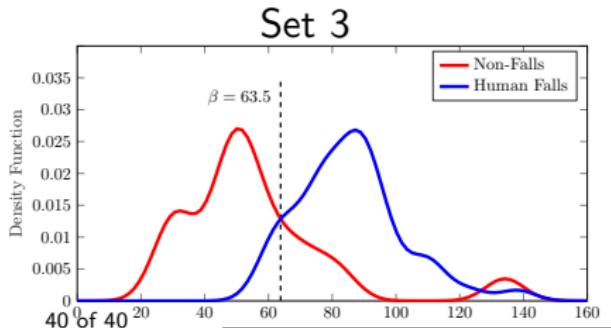

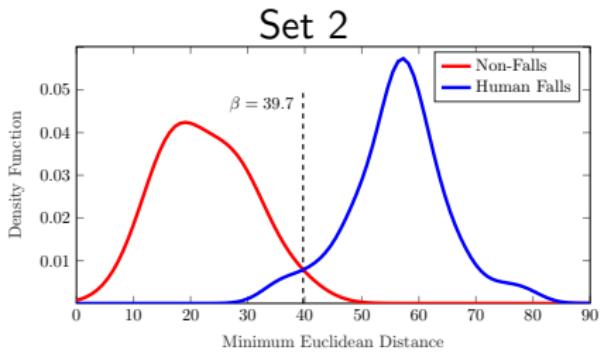

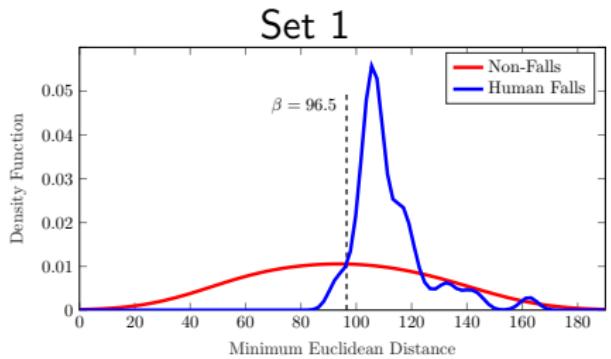

Optimization of the End-to-End Autoencoder

Table: Hyper-parameters optimized in the random-search phase, and their range.

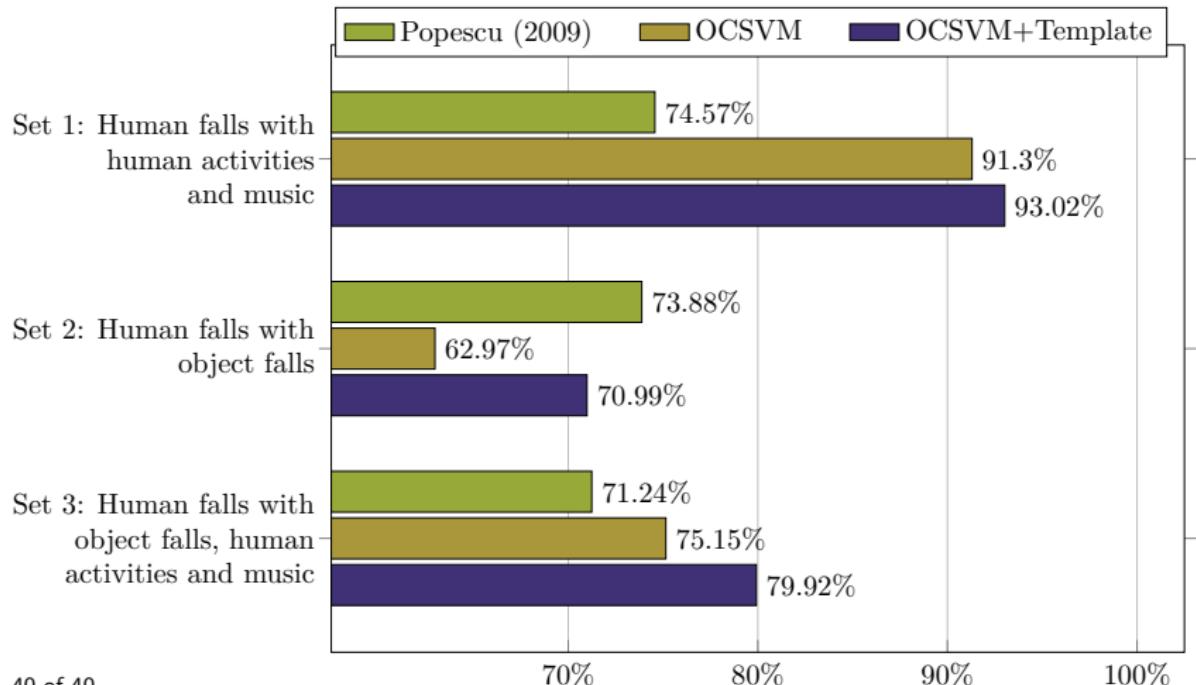

| Parameter | Range | Distribution | Parameter | Range | Distribution |
|-----------------|------------|--------------|----------------|---------------------|--------------|
| Cnn layer Nr. | [1-3] | uniform | Batch size | [10%-25%] | log-uniform |
| Kernel shape | [3x3-8x8] | uniform | Max pool shape | [1x1-5x5] | uniform |
| Kernel Nr. | [4-64] | log-uniform | Max Pool | All-Only end | uniform |
| MLP layers Nr. | [1-3] | uniform | Dropout | [Yes-No] | uniform |
| MLP layers dim. | [128-4096] | log-unifom | Drop rate | [0.5-0.6] | normal |
| Stride | [1x1-3x3] | uniform | Learning rate | $[10^{-4}-10^{-2}]$ | log-unifom |

Template-matching decision threshold in clean condition

The choice of β has been performed by calculating the minimum Euclidean distance between each fall and non-fall event in the validation set and the set of templates

OCSVM Template Matching Results in Noisy condition

Preliminary results for SCAE approach

Table: Preliminary result for different pairs generation strategies.

| Technique | Result in R1 | Result in R2 | Overall |
|--------------------------------------|--------------|--------------|---------------|
| \mathcal{P} - \mathcal{N} -PAIRS | 55.17% | 64.74% | 60.13% |
| \mathcal{N} -PAIRS | 76.20% | 67.53% | 72.05% |
| NO-PAIRS | 91.71% | 89.88% | 90.97% |
| \mathcal{P} -PAIRS | 92.54% | 92.54% | 92.54% |

Hyper-parameters optimized for SCAE approach

Table: Hyper-parameters optimized in the random-search phase and their range.

| Parameter | Range | Distribution |
|-----------------|-----------|--------------|
| Cnn layer Nr. | [1-3] | Uniform |
| Kernel shape | [1x1-8x8] | Uniform |
| Kernel Nr. | [1-32] | Uniform |
| MLP layers Nr. | [1-2] | Uniform |
| MLP layers dim. | [1-4096]% | Log-uniform |
| Max pool shape | [0x0-3x3] | Uniform |
| Drop rate | [0-0.2]% | Uniform |
